## VOEN self-ventilating covers

The VOEN covers consist of a special hail net with plastic flaps stitched to it. During rain, the weight of the water keeps the flaps closed. Once the sky clears up, the wind will lift the flaps and provide natural ventilation under the cover, removing any accumulated humidity and heat. The self-ventilating covers offer a unique combination of a high wind tolerance and an optimal microclimate. And the benefits are very well appreciated by fruit & vegetable growers worldwide: healthy plants, high quality yield, and low labor intensity. Those are the ingredients of our success for more than 15 years.

### About us

We are a family owned covering business founded in the south of Germany in 2002. With a solid background in fruit growing, Reinhard and Doris Vöhringer designed a unique self-ventilating covering system, which today is defining the standard for crop covers around the world.

*...and by the way, we are still growing fruits!*

## Keeping your labor costs at a minimum

With our farmers background we know that simplicity and efficiency is the way to reduce labor costs. The VOEN Zip is the perfect example of this. Opening and closing the covers has never been quicker, and the zip also makes the cover complete bird and insect proof.

## Simple and durable design

Whether you prefer to work with steel, wood or concrete, VOEN is providing everything you need to build a stable construction for your VOEN covers. We are combining simplicity and durability into a unique construction, which you can easily build by yourself. Depending on your needs, we also offer onsite support by our technicians or full turn-key installations.

## Innovations for farmers by farmers

Although the unique principle of the VOEN covers have remained the same for almost 20 years, we constantly develop and test new solutions at the VOEN Farm in Southern Germany. An example is the VOEN Hibernation System 2.0 which simplifies the hibernation process and reduces labor costs by more than 50% when handling the covers.

## We cover your needs

Fruit and vegetable growers from more than 25 countries have already experienced the versatility of the VOEN Covering System. The flexible design and the healthy microclimate under the covers offer a valuable protection against weather and insects to a wide range of crops grown in many different environments. No slope is too steep, and no climate is too extreme – we will cover your needs for protecting your high value crop!
